

Smart Shelf for Intelligent Inventory Management

Barry Wang | Nico Shinozaki | Josephine Nghiem | Tamer Tamer | Justin Zhang

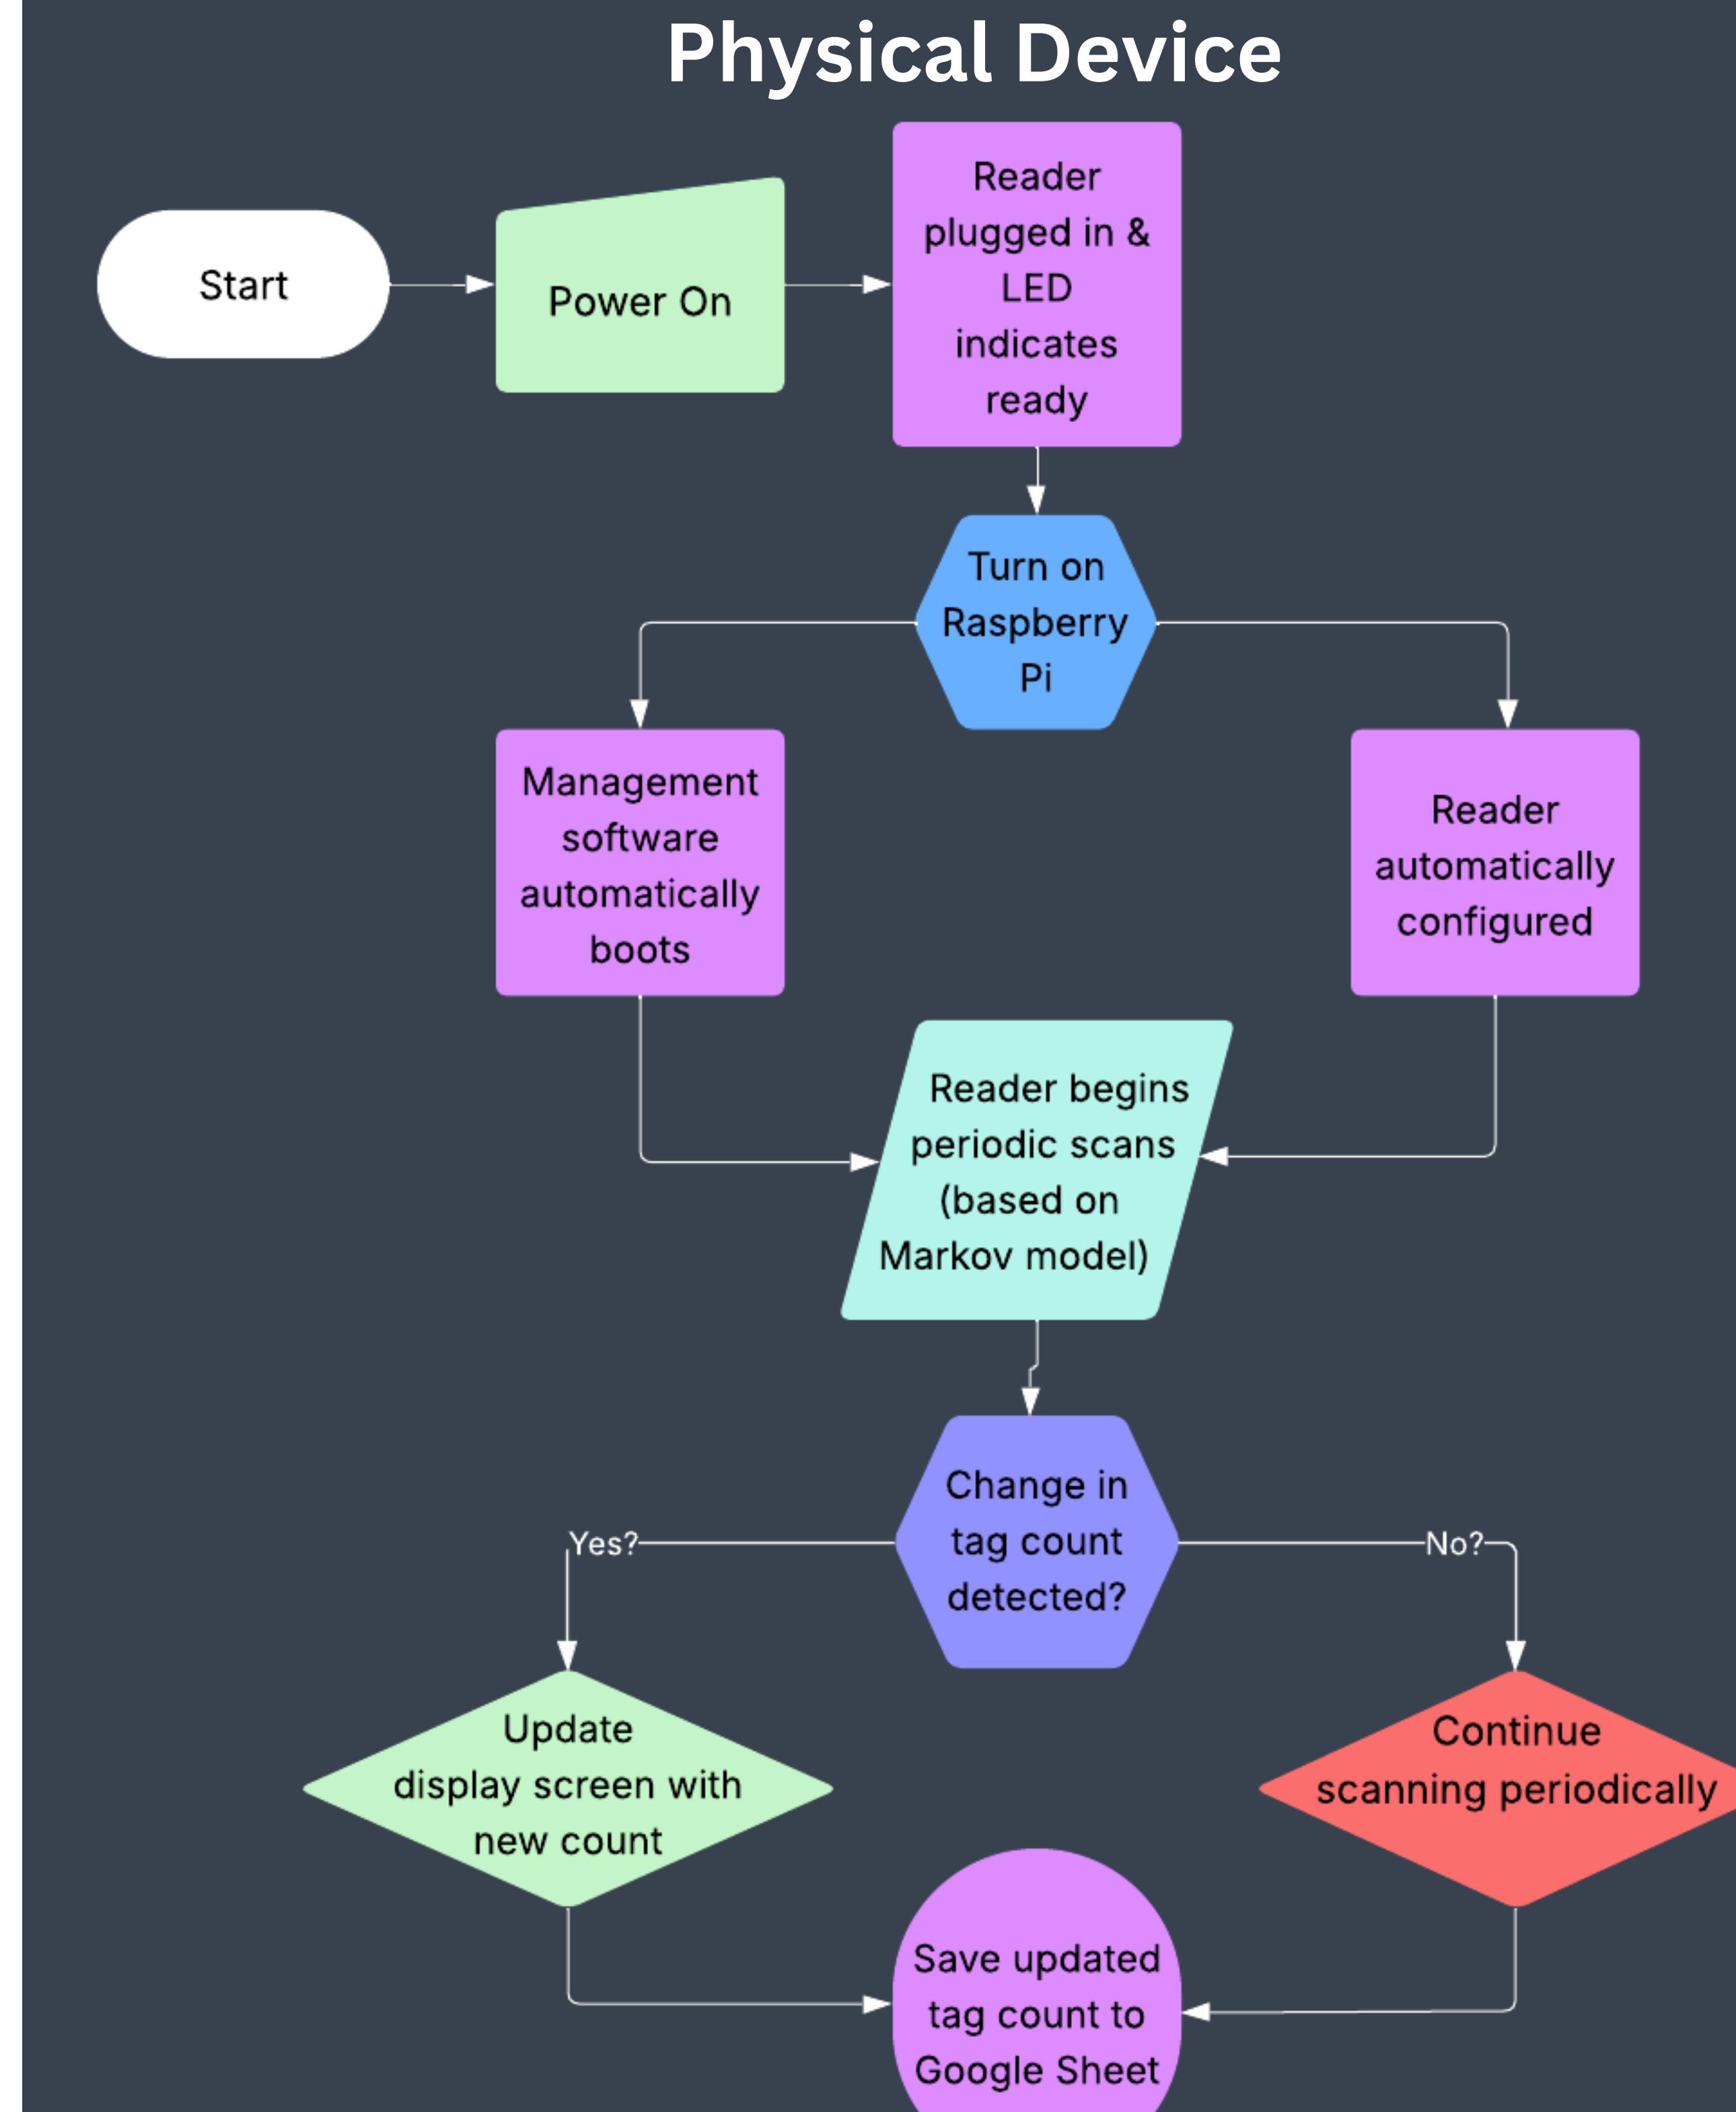

Overview

Traditional inventory management in clinical and lab settings is often manual, slow, and error-prone, leading to stockouts, misplaced items, and poor supply tracking. These issues disrupt operations, raise costs, and put patient care at risk. To address this, we developed an intelligent shelving system using UHF RFID to automate real-time inventory tracking and make the process easier for users. Our smart shelving system automatically tracks items as they are added or removed, with each shelf unit featuring a display that shows real-time inventory, giving users instant insight into stock levels. Inventory data syncs wirelessly to a web application, enabling authorized users to remotely monitor, review, and manage updates from anywhere. This ensures accurate, efficient, and reliable inventory control across all platforms and fully streamlines and automates the item/tag tracking process.

Software Flow

Main Parts

RFID Reader

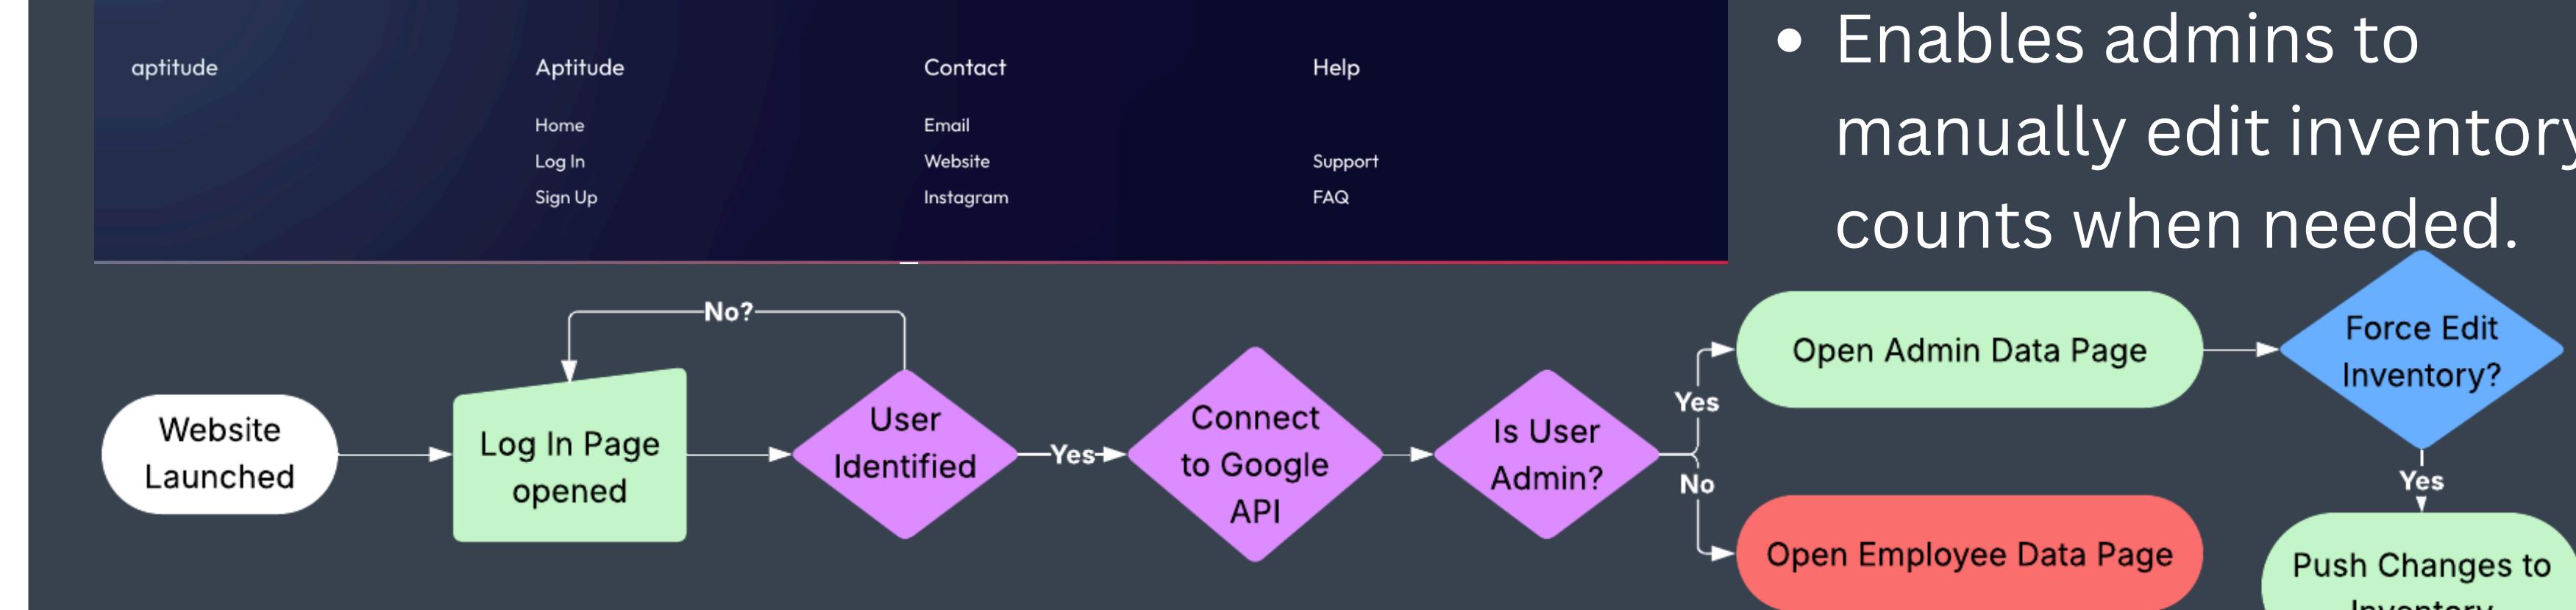

- A Zebra FX9600 reads RFID tags inside the shelf
- Connects to the Raspberry Pi for inventory management

RFID Antenna

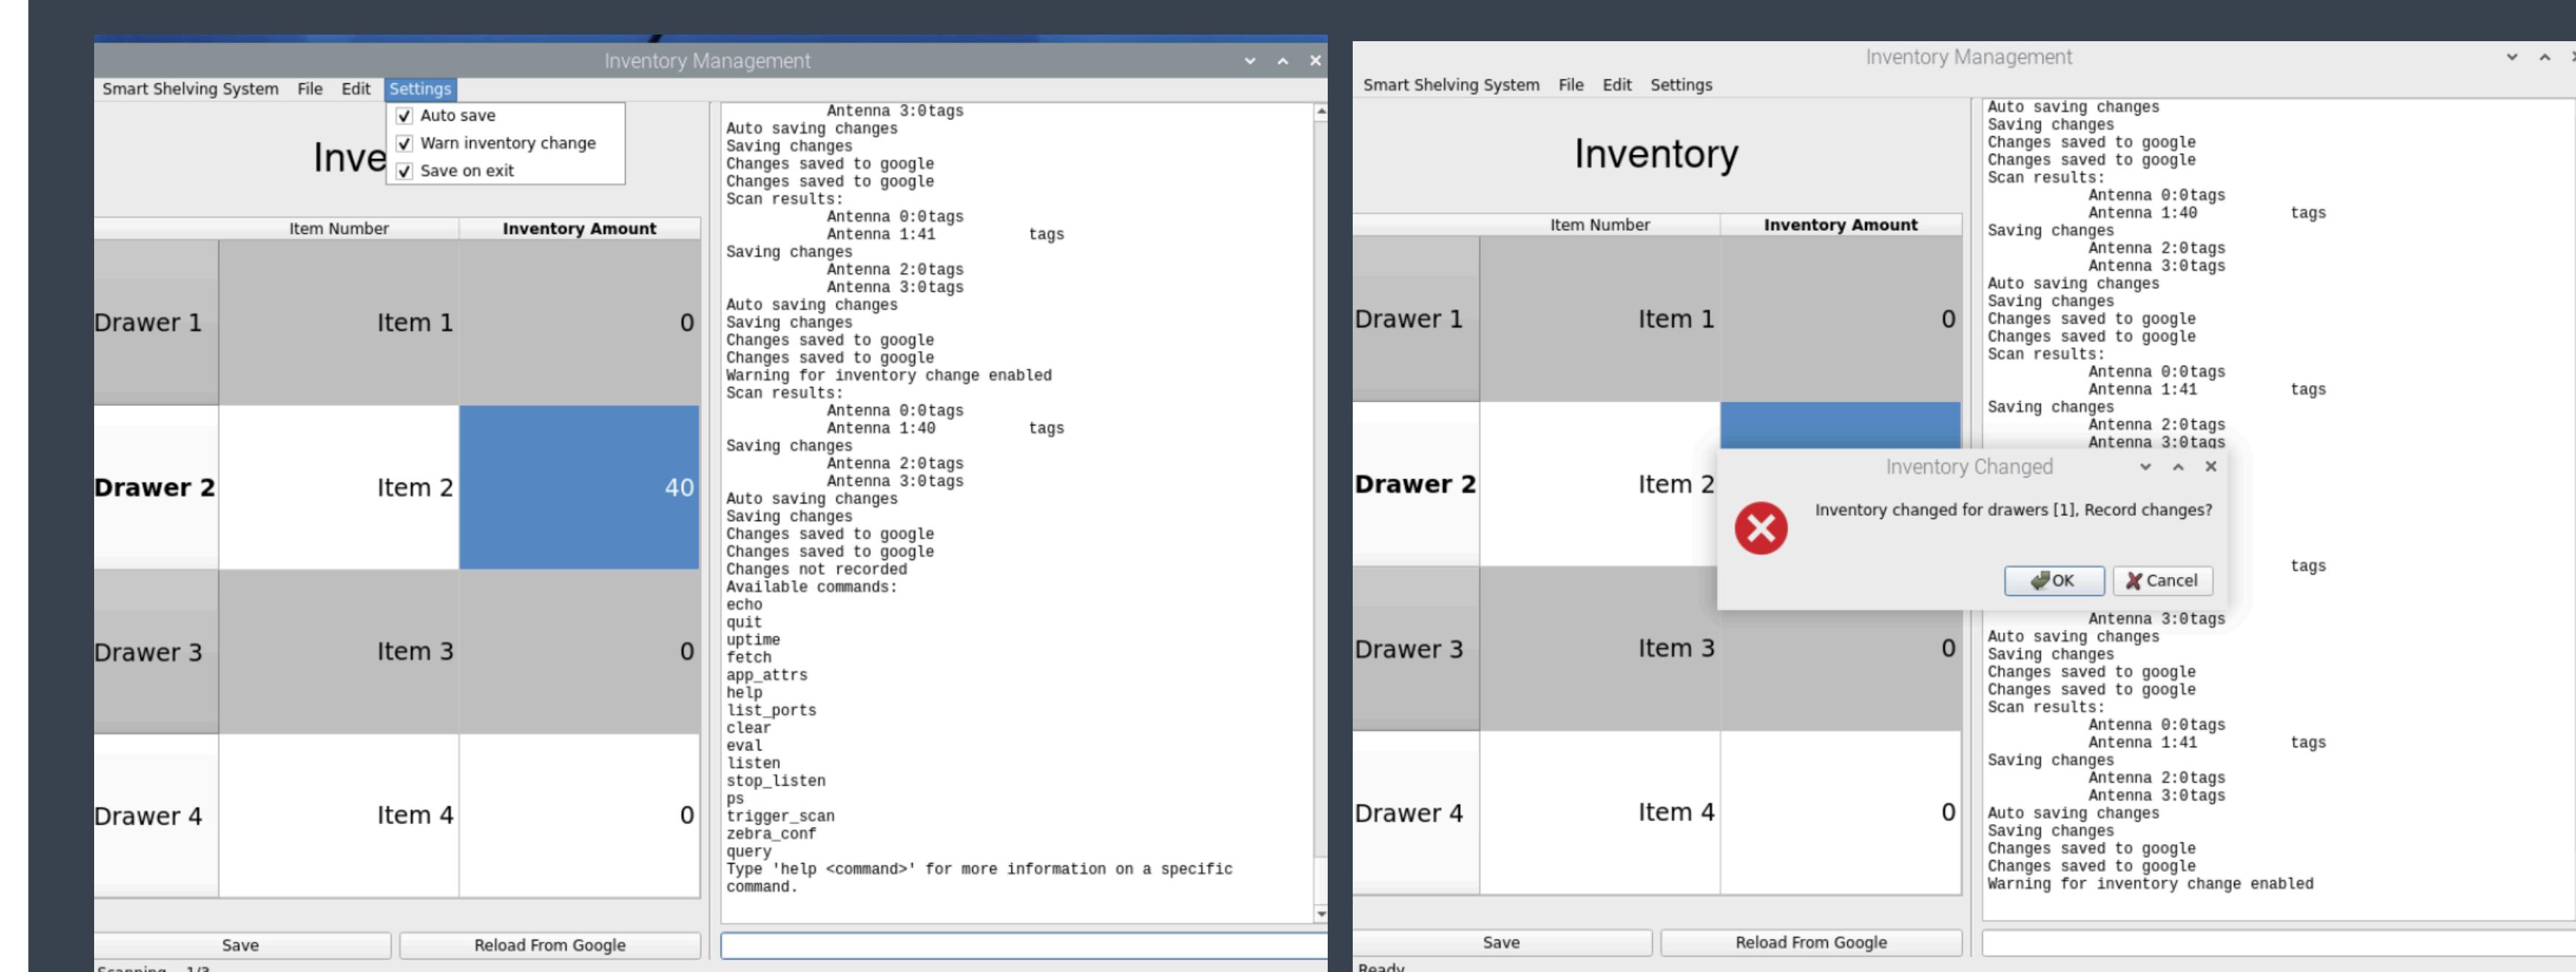

- A Vulcan P11 UHF Antenna detects RFID tags in the shelf
- Connected to the reader with RP-TNC Male to SMA Male cables

Web Application

Product Name	Part Number	Amount in Inventory	Activity
Capacitor	RX2331	1	→
Test Tubes	SR1443	12	→
Board	DI112K	165	→
1KLED	LED1K	13	→
PX Console	PX8899	54	→
Resistor 20 Ohms	TKXD3E	245	→
